
F7. THIS INSTANCE DOES NOT CONTRADICT RANKME AS STATED. High rank with degraded information is exactly the necessary-not-sufficient case RankMe reserves for itself, and LiDAR's own text says so. What is added here is the MAGNITUDE of the miscalibration, on a representation with zero fitted parameters - so section 3.5's retraining noise does not apply, and rank and channel are read from the same representation through the same instrument. Single seed (42), single draw of donor assignments, no error bar on any level-to-level difference; the detection floor is censored at >= 0.40 from d = 0.09 onward and the transmission floor at 0.05 from below; the curve is a property of unweighted mean pooling, not of the modality. The source file's own section 4 WITHDRAWS the phrase "lower bound": the measured quantity is the cost of preparation-matched, information-free contamination. Do not describe (a)'s ratio curve as monotone.
